There is no transmembrane domain. The amino acid sequence is predicted from a cDNA clone (see also T73520) obtd. from human myeloma U266 cells. Soluble, non-membrane bound IFNAR splice-deleted forms 1 and 2 (see also W21806) probably regulate the response of human cells to IFNS, either by acting as IFN antagonists or by regulating the activity of the multiple IFN subtypes. They can be expressed in host cells and used to inhibit, modulate or modify the activities of IFNS alpha and beta in cells, telssues and organisms, or for diagnostic purposes.
                                                                                                                                          11-MAY-1995.

23-MAR-1995.
Compsn. of monoclonal antibodies against interferon receptor useful as immuno:modulator, eg. for treating AIDS Disclosure; Fig.2A-2B; 105pp; English. A recombinant soluble form of the human interferon class I receptor protein extracellular domain, given in R71723, was expressed in either E. coli or COS cell hosts. The protein was used to raise immunomodulatory monoclonal antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          purposes

Novel, splice-deleted IFNAR forms 1 (W21805) and 2 (W21806) have been detected that lack this transmembrane domain. These, soluble non-membrane bound polypeptides can be expressed in host cells and used to inhibit, modulate or modify the activities of interferons alpha and beta in cells, tissues and organisms, or for diagnostic

             Inhibiting, modulating or modifying the activities of interferon(s)

PS Example 3; Fig 7; 46pp; English.

CC Novel splice-deleted interferon alpha-receptor (IFNAR) form 2

CC (W21806) is characterised by a double deletion when compared to

CC characterised by a double deletion when compared to

CC shortened by 6 amino acid residues and is followed by a truncated

CC intracellular domain. There is no transmembrane region. The amino

CC acid sequence is predicted from a cDNA clone (see also T73521) obtd.

CC from human myeloma U266 cells. Soluble, non-membrane bound IFNAR

CC splice-deleted forms 1 (see also W21805) and 2 may regulate the

CC antagonists or by regulating IFN activities. They can be expressed

CC in host cells and used to inhibit, modulate or modify the

CC activities of IFNs alpha and beta in cells, tissues and organisms,

CC corrections of the composes.

          PS Claim 2; Page -; 79pp; English.

CC This sequence is the human CRFB4 sequence, DNA encoding it is used in the crecombinant DNA (I) of the invention. (I) comprises a sequence (S1) CC encoding the interleukin-10 (IL-10) receptor (ILLOR) and a sequence (S2) encoding the interleukin-10 (IL-10) receptor (ILLOR) and a sequence (S2) concoding CRFB4, both operably linked to expression control sequences. CC cells containing (I) may be used to identify agonists/antagonist of IL-10. Agonists are potentially useful, e.g. for preventing allograft crejection, as vaccine adjuvants, for treatment of photosensitivity. CC infiammation, autoimmune disease and septic shock, while antagonists are potentially useful for increasing immune responses against tumours, and crivity useful for increasing immune responses against tumours, and continuous parasites (especially intracellular pathogens) and CC for preventing organ rejection. A vector containing (I) is used to creatore, e.g. by gene therapy, IL-10 sensitivity to a cell that expresses a dysfunctional ILlOR and is able to bind IL-10 but not to transduce a csignal. Antisense CRFB4 sequences (especially ribozymes), can inhibit CL IL-10 activity in cells. Antibodies specific for CRFB4 are used to company the company of the company
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

Recombinant beta-subunit, pref. with the transmembrane anchoring domain deleted or inactivated and with the cytoplasmic domain deleted, may be may be used to treat pathological conditions associated with endogenous IFN-gamma production.

Sequence 332 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RNA. Agonists/antagonists may be administered parenterally, orally or rectally especially by intravenous injection or directly into a tumour or allograft.
                                                                                                                                                                                                                                                                                                                                                                    Novel interferon gamma receptor beta chain polypeptide - for treatment of inflammatory bowel disease and liver damage Claim 3; Fig.2A; 86pp; English.

The IFN-gamma receptor beta-subunit encoded by a cDNA clone derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (BOEH/) BOEHNI R.

                                                        PT Novel human Zeytor7 DNA encodes a type 2 cytokine receptor - useful for treating renal, neural, pancreatic and prostatic diseases SC laim 1; Pages 55-59; 72pp; English.

Claim 1; Pages 55-59; 72pp; English.

Chis represents the Zeytor7 cytokine receptor. Zcytor7 is a ligand-binding receptor polypeptide and is a novel member of the type 2 cytokine receptor family (CRF2). An expression vector containing the Zcytor polynucleotide, operably linked to transcription promoter, a sequence encoding a transmembrane and intracellular domain, or both, and a transcriptional terminator can be used to transform host cells for the transcriptional terminator and be used to transcriptions of the Scytor7 gene and to isolate ligands binding to it. Zcytor7 is preferentially expressed in the kidney, pancreas, prostate or nervous tissue. Agonists of Zcytor7 can be used to stimulate proliferation and differentiation of cell in these organs. The antagonists and agonists can also be used in the treatment of renal, neural, pancreatic and prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Adams RL, Farrah T. The sequence is that of human interferon-gamma accessory factor-1. Incorporation of AF-1 into immune and tumour cells re-establishes normal function with elimination of malignant cells. Sequence 337 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         N-PSDB; Q84697
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           W09505847-A.

interferon gamma receptor beta subunit - mouse
N;Alternate names: IFN-gamma R beta chain; IFN-gamma R species-specific coft
C;Species: Mus musculus (house mouse)
C;Date: 06-Oct-1994 #sequence_revision 18-Nov-1994 #text_change 05-Nov-1999
C;Accession: A49947
R;Hemmi, S.; Bohni, R.; Stark, G.; Di Marco, F.; Aguet, M.
cell 76, 803-810, 1994
A;Title: A novel member of the interferon receptor family complements functi
A;Reference number: A49947; MUID:94170381
A;Accession: A49947
